- Expectation

$$E[X] = \sum_x x \cdot p(X = x)$$

- Properties

$$E[X + Y] = E[X] + E[Y]$$
$$E[cX] = cE[X]$$
$$E[c] = c$$

c is a constant

- Conditional expected value

$$E[X|Y = y] = \sum_x x \cdot p(X = x|Y = y)$$

- Variance

$$Var[X] = E[(X - E[X])^2] = E[X^2] - (E[X])^2$$

- Properties

$$Var[cX] = c^2 Var[X]$$

- Covariance

$$Cov(X, Y) = E[(X - E[X])(Y - E[Y])] = E[XY] - E[X]E[Y]$$

$$Cov(X, X) = E[X^2] - E[X]E[X] = Var(X)$$

- Variance of $X + Y$

$$Var[X + Y] = Var[X] + Var[Y] + 2Cov[X, Y]$$

Correlation

$$\mathbf{Corr}(X, Y) = \frac{\mathbf{Cov}(X, Y)}{\sigma_X \sigma_Y}$$

3

Outline

4

- For independent RVs X_1 and X_2
  - $E(X_1X_2)$
  - $Var(X_1 + X_2)$
  - $Cov(X_{1,}X_2)$

Correlation($X_{1,}$ X_2)

4

Independence and Moments

5

Theorem: *If* $X \perp Y$ *then* $\mathbf{E}[XY] = \mathbf{E}[X]\mathbf{E}[Y]$.

Comparison: $\mathbf{E}[X + Y] = \mathbf{E}[X] + \mathbf{E}[Y]$ regardless of independence!

5

Independence and Moments

6

Scaling of Summations

$\lambda \sum_{i=1}^{n} x_i = \sum_{i=1}^{n} \lambda x_i$

Theorem: *If* $X \perp Y$ *then* $\mathbf{E}[XY] = \mathbf{E}[X]\mathbf{E}[Y]$.

Proof:

$$\begin{aligned}\mathbf{E}[XY] &= \sum_x \sum_y (x \cdot y) p(X = x, Y = y) \\ &= \sum_x \sum_y (x \cdot y) p(X = x) p(Y = y) \quad \textbf{(Independence)} \\ &= \left(\sum_x x \cdot p(X = x)\right)\left(\sum_y y \cdot p(Y = y)\right) = \mathbf{E}[X]\mathbf{E}[Y] \quad \textbf{(Linearity of Sum)}\end{aligned}$$

Example *Let* $X_1, X_2 \in \{1, \ldots, 6\}$ *be RVs representing the result of rolling two fair standard dice. What is the mean of their product?*

$$\mathbf{E}[X_1 X_2] = \mathbf{E}[X_1]\mathbf{E}[X_2] = 3.5^2 = 12.25$$

6

Independence and Moments

7

Question: *What is the variance of their sum (recall independence)?*

$Cov(X,Y) = E[(X - E[X])(Y - E[Y])]$
$= E[XY] - E[X]E[Y]$

- Proof 1:

$$\begin{aligned}\mathbf{Var}[X_1 + X_2] &= \mathbf{Var}[X_1] + \mathbf{Var}[X_2] + 2\mathbf{Cov}(X_1, X_2) \\ &= \mathbf{Var}[X_1] + \mathbf{Var}[X_2] + 2\mathbf{E}[(X_1 - \mathbf{E}[X_1])(X_2 - \mathbf{E}[X_2])] \\ &= \mathbf{Var}[X_1] + \mathbf{Var}[X_2] + 2\mathbf{E}[(X_1 - \mathbf{E}[X_1])]\mathbf{E}[(X_2 - \mathbf{E}[X_2])] \\ &= \mathbf{Var}[X_1] + \mathbf{Var}[X_2] + 2\left(\mathbf{E}[X_1] - \mathbf{E}[X_1]\right)\left(\mathbf{E}[X_2] - \mathbf{E}[X_2]\right) \\ &= \mathbf{Var}[X_1] + \mathbf{Var}[X_2]\end{aligned}$$

- $A \perp B \Rightarrow f(A) \perp f(B)$
- $f(X) = X - E[X]$
- $E[f(A)f(B)] = E[f(A)]E[f(B)]$

- Proof 2:

$$\begin{aligned}Var[X_1 + X_2] &= Var[X_1] + Var[X_2] + 2Cov[X_1, X_2] \\ &= Var[X_1] + Var[X_2] + 2(E[X_1 X_2] - E[X_1]E[X_2]) \\ &= Var[X_1] + Var[X_2] + 2(E[X_1]E[X_2] - E[X_1]E[X_2]) \\ &= Var[X_1] + Var[X_2]\end{aligned}$$

7

Independence and Moments

8

Recall that for any two RVs X and Y variance is not a linear function,

$$\mathbf{Var}[X+Y] = \mathbf{Var}[X] + \mathbf{Var}[Y] + 2\mathbf{Cov}(X,Y)$$

If X and Y are independent then they have zero covariance,

$$\mathbf{Cov}(X,Y) = 0$$

Thus, $$\mathbf{Var}[X+Y] = \mathbf{Var}[X] + \mathbf{Var}[Y]$$

And, for a collection of independent RVs $X_1, X_2, \ldots, X_N$ we have,

$$\mathbf{Var}(\sum_{i=1}^{N} X_i) = \sum_{i=1}^{N} \mathbf{Var}(X_i)$$

Q: Is variance a linear operator under independence?

A: No! $Var(cX) \neq c\, Var(X)$ for a constant c. Rather, $Var(cX) = c^2 Var(X)$.

8

Linearity

9

In mathematics, a linear map or linear function $f(x)$ is a function that satisfies the two properties:[1]

- Additivity: $f(x + y) = f(x) + f(y)$.
- Homogeneity of degree 1: $f(\alpha x) = \alpha f(x)$ for all α. Homogeneous must pass: $f(zx, zy) = z^n f(x, y)$

Homogeneous?

$f(x, y) = 4x^2 + y^2 \Rightarrow$ homogeneous with degree 2: $f(zx, zy) = z^2 f(x, y)$

$\Rightarrow$ not linear

So, expectation is a linear function/operator, but variance is not !

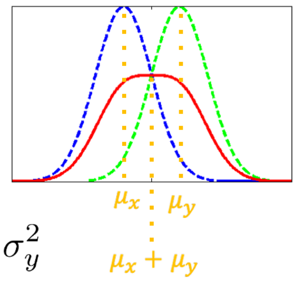
We will just say "linearity of expectation"

9

Example: Independent Gaussian RVs

10

Let X and Y be **independent** Gaussian RV with,



$$X \sim \mathcal{N}(\mu_x, \sigma_x^2) \qquad Y \sim \mathcal{N}(\mu_y, \sigma_y^2)$$

(Property of Gaussian: $\mathrm{E}[X] = \mu_x$, $Var[X] = \sigma_x^2$)

What is the variance of their sum?

$$\mathbf{Var}(X+Y) = \mathbf{Var}(X) + \mathbf{Var}(Y) = \sigma_x^2 + \sigma_y^2$$

What is the mean of their product?

$$\mathbf{E}[XY] = \mathbf{E}[X]\mathbf{E}[Y] = \mu_x \mu_y$$

Suppose X and Y are **dependent**, what is the mean of their sum?

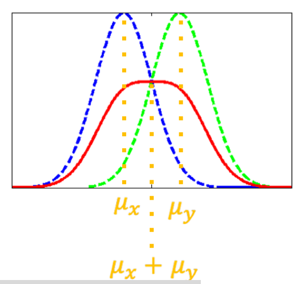
$$\mathbf{E}[X+Y] = \mathbf{E}[X] + \mathbf{E}[Y] = \mu_x + \mu_y$$

10

The amazing Gaussian

11

Let X and Y be **independent** Gaussian RVs with,



$$X \sim \mathcal{N}(\mu_x, \sigma_x^2) \qquad Y \sim \mathcal{N}(\mu_y, \sigma_y^2)$$

For normal distributions

- Closed under additivity:

  $X \sim \mathcal{N}(\mu_x, \sigma_x^2) \quad Y \sim \mathcal{N}(\mu_y, \sigma_y^2) \quad , X \perp Y$

  $X + Y \sim \mathcal{N}(\mu_x + \mu_y, \sigma_x^2 + \sigma_y^2)$

- Closed under affine transformation (a and b constant):

  $aX + b \sim \mathcal{N}(a\mu_x + b, a^2\sigma_x^2)$

Remember the example of the frogs from last meeting.

x_i are independent.

So what is the avg and variance of the offspring ?

11

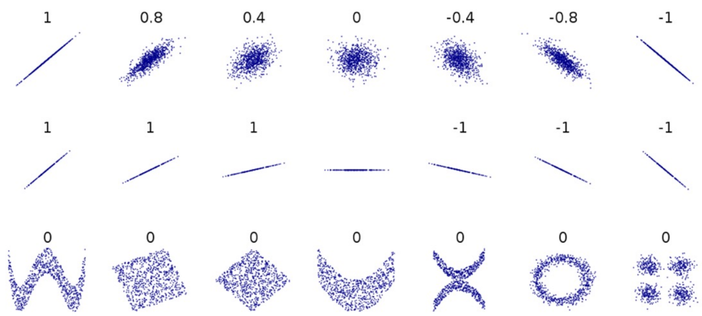
Independence and Moments

12

If X and Y are independent RVs, then:

$$\mathbf{Cov}(X, Y) = 0$$

The reverse is not true! $(\mathbf{Cov}(X, Y) = 0) \nRightarrow X \perp Y$



12

Moments of Continuous RVs

14

Replace all sums with integrals,

$$\mathbf{E}[X] = \int x p(x)\, dx \qquad \mathbf{Var}[X] = \int (x - \mathbf{E}[X])^2 p(x)\, dx$$

- All properties push through, as you would expect (e.g. law of total expectation, conditional expectation, etc.)

(and use PDF p(x) instead of PMF P(X=x))

14

Exercise

15

Question: *Roll two dice and let their outcomes be* $X_1, X_2 \in \{1, \dots, 6\}$ *for die 1 and die 2, respectively. Recall the definition of conditional probability,*

$$p(X_1 \mid X_2) = \frac{p(X_1, X_2)}{p(X_2)}$$

Which of the following are true?

a) $p(X_1 = 1 | X_2 = 1) > p(X_1 = 1)$

b) $\boxed{p(X_1 = 1 | X_2 = 1) = p(X_1 = 1)}$ Outcome of die 2 doesn't *affect* die 1

c) $p(X_1 = 1 | X_2 = 1) < p(X_1 = 1)$

15

Exercise

16

Question: *Let* $X_1 \in \{1, \dots, 6\}$ *be outcome of die 1, as before. Now let* $X_3 \in \{2, 3, \dots, 12\}$ *be the* sum of both dice. Which of the following are true?

a) $\boxed{p(X_1 = 1 | X_3 = 3) > p(X_1 = 1)}$

b) $p(X_1 = 1 | X_3 = 3) = p(X_1 = 1)$

c) $p(X_1 = 1 | X_3 = 3) < p(X_1 = 1)$

Only 2 ways to get $X_3 = 3$ *, each with equal probability:*

$(X_1 = 1, X_2 = 2)$ *or* $(X_1 = 2, X_2 = 1)$

so

$$p(X_1 = 1 \mid X_3 = 3) = \frac{1}{2} > \frac{1}{6} = p(X_1 = 1)$$

16

Review

17

We have covered a lot of ground on probability in short time…

Discrete Random Processes

- Definition of sample space / random events
- Axioms of probability
- Uniform probability of random event
- Random Variables
- Fundamental rules of probability (chain rule, conditional, law of total probability)

Probability Distributions

- Useful discrete probability mass functions
- Introduction to continuous probability
- Useful probability density functions

Moments / Independence

- Expected Value
- Linearity
- Variance, Covariance, Corr.
- Dependent / Independent RVs
