2

Estimating current scores

- Assignments: 36%
- Midterm: 20%
- Project: 14%
- Final Exam: 20%
- Participation: 10%
- 7 homeworks, drop the lowest one.
 - Each 6 points
 - e.g., $6 * 120/130 = 5.54$ -- if a homework total points are 130 and you got 120

3

4

Model Evaluation

4

Confusion Matrix

5

Suppose our classifier distinguishes between cats and non-cats.

We can make the following table called **confusion matrix**:

Predicted class \ Actual class	Cat	Non-cat
Cat	6 true positives	2 false negatives
Non-cat	1 false positive	3 true negatives

It tells us if classifier is biased towards certain mistakes (False Positives, False Neg.)

Good for investigating opportunities to improve the classifier.

5

Evaluating Classifiers - Precision

6

		Predicted	
		Positive	Negative
Actual	Positives	True Positives	False Negatives
	Negatives	False Positives	True Negatives

Precision: dividing the true positives by anything that was predicted as a positive.

$$\frac{\text{True Positives}}{\text{True Positives} + \text{False Positives}}$$

6

3

Evaluating Classifiers - Recall

7

		PREDICTED	
		POSITIVE	NEGATIVE
ACTUAL	POSITIVES	TRUE POSITIVES	FALSE NEGATIVES
	NEGATIVE	FALSE POSITIVES	TRUE NEGATIVES

Recall (or True Positive Rate): dividing the true positives by anything that should have been predicted as positive.

$$\frac{\text{TRUE POSITIVES}}{\text{TRUE POSITIVES} + \text{FALSE NEGATIVES}}$$

7

Evaluating Classifiers

8

F1 score symmetrically represents both precision and recall in one metric.

$$F_1 = \frac{2}{\text{recall}^{-1} + \text{precision}^{-1}} = 2 \cdot \frac{\text{precision} \cdot \text{recall}}{\text{precision} + \text{recall}} = \frac{\text{tp}}{\text{tp} + \frac{1}{2}(\text{fp} + \text{fn})}$$

- This is the *harmonic mean* of precision and recall
 - harmonic_mean(x,y)

$$\frac{1}{\frac{1}{x} + \frac{1}{y}}$$

- Gives equal importance to precision and recall – F1 may not be best when you care about one more than the other (e.g., in medical tests we care about recall)

8

Evaluation in Scikit-Learn

9

Evaluation functions live in metrics

<code>metrics.confusion_matrix(y_true, y_pred, *)</code>	Compute confusion matrix to evaluate the accuracy of a classification.	
<code>metrics.dcg_score(y_true, y_score, *[k, ...])</code>	Compute Discounted Cumulative Gain.	
<code>metrics.det_curve(y_true, y_score[, ...])</code>	Compute error rates for different probability thresholds.	
<code>metrics.f1_score(y_true, y_pred, *[...,])</code>	Compute the F1 score, also known as balanced F-score or F-measure.	
<code>metrics.fbeta_score(y_true, y_pred, *, beta)</code>	Compute the F-beta score.	
<code>metrics.hamming_loss(y_true, y_pred, *[...,])</code>	Compute the average Hamming loss.	
<code>metrics.hinge_loss(y_true, pred_decision, *)</code>	Average hinge loss (non-regularized).	
<code>metrics.jaccard_score(y_true, y_pred, *[...,])</code>	Jaccard similarity coefficient score.	
<code>metrics.log_loss(y_true, y_pred, *[..., eps, ...])</code>	Log loss, aka logistic loss or cross-entropy loss.	
<code>metrics.matthews_corrcoef(y_true, y_pred, *)</code>	Compute the Matthews correlation coefficient (MCC).	
<code>metrics.multilabel_confusion_matrix(y_true, ...)</code>	Compute a confusion matrix for each class or sample.	
<code>metrics.ndcg_score(y_true, y_score, *[k, ...])</code>	Compute Normalized Discounted Cumulative Gain.	
<code>metrics.precision_recall_curve(y_true, ...)</code>	Compute precision-recall pairs for different probability thresholds.	
<code>metrics.precision_recall_fscore_support(...)</code>	Compute precision, recall, F-measure and support for each class.	
<code>metrics.precision_score(y_true, y_pred, *[...,])</code>	Compute the precision.	
<code>metrics.recall_score(y_true, y_pred, *[...,])</code>	Compute the recall.

Naïve Bayes

10

Naïve Bayes Overview

11

Heads Up This section will return to some math as we go in depth. But, much of it is that you already know with a new application (Naïve Bayes Classification) – **ask questions if you are lost**

- Introduction to Naïve Bayes Classifier
- Maximum Likelihood Estimation

11

Math Prep

- N RVs conditionally independent, given Z, if and only if:

$$p(X_1, \dots, X_N | Z) = \prod_{i=1}^N p(X_i | Z) \quad \text{Probability 3, page 25}$$

- Bayes' rule

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = \frac{P(B|A)P(A)}{P(B)} \quad \text{Probability 2, page 24}$$

- Maximum likelihood estimation

Statistics 2

- Bernoulli and Gaussian distribution

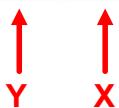

Probability 3, 4
Statistics 2

12

Intuition

Training Data:

Person	height (feet)
male	6
male	5.92 (5'11")
male	5.58 (5'7")
male	5.92 (5'11")
female	5
female	5.5 (5'6")
female	5.42 (5'5")
female	5.75 (5'9")

Task: observe feature x_n , predict label $y_n \in (0, 1)$

Choose the class with higher probability:

$$P(Y_n = 1|X_n = x_n) \text{ vs } P(Y_n = 0|X_n = x_n)$$

$$P(Y_n = 1|X_n = x_n) = \frac{P(Y_n = 1, X_n = x_n)}{P(X_n = x_n)}$$

$$P(Y_n = 0|X_n = x_n) = \frac{P(Y_n = 0, X_n = x_n)}{P(X_n = x_n)}$$

How to learn a joint probability model for $P(Y, X)$?

13

14

Probabilistic Approach to ML

Training Data:

Person	height (feet)	weight (lbs)	foot size(inches)
male	6	180	12
male	5.92 (5'11")	190	11
male	5.58 (5'7")	170	12
male	5.92 (5'11")	165	10
female	5	100	6
female	5.5 (5'6")	150	8
female	5.42 (5'5")	130	7
female	5.75 (5'9")	150	9

Task: Observe features x_1, \dots, x_D and predict class label $y \in \{1, \dots, C\}$

Model: Assume that the feature x and its label y follows certain type of distribution \mathcal{D} with parameter θ .

$$(x, y) \stackrel{\text{i.i.d.}}{\sim} \mathcal{D}_\theta$$

Training Algorithm: Estimate θ e.g., MLE $\hat{\theta}$

To classify: Compute

$$\hat{y} = \arg \max_{c \in \{1, \dots, C\}} p(y = c | x; \hat{\theta})$$

what comes after semicolon is the parameter of the distribution

14

Naïve Bayes is a Specific Probabilistic Approach

15

Training Data:

Person	height (feet)	weight (lbs)	foot size(inches)
male	6	180	12
male	5.92 (5'11")	190	11
male	5.58 (5'7")	170	12
male	5.92 (5'11")	165	10
female	5	100	6
female	5.5 (5'6")	150	8
female	5.42 (5'5")	130	7
female	5.75 (5'9")	150	9

Features

Task: Observe features x_1, \dots, x_D and predict class label $y \in \{1, \dots, C\}$

Naïve Bayes Model: Treat features as *conditionally independent* given class label,

$$p(x, y) = p(y)p(x|y) = p(y) \prod_{d=1}^D p(x_d | y)$$

build individual models for these

To classify a given instance x : Bayes rule!

$$p(y = c | x) = \frac{p(y = c)p(x | y = c)}{p(x)}$$

15

Key concept in Naïve Bayes

$$p(x, y) = p(y)p(x|y) = p(y) \prod_{d=1}^D p(x_d | y)$$

Class prior distribution Class conditional distribution

Given one data point, it has 4 features (input), and the label is 0 (output)

$$\begin{aligned}
 p(x_1, x_2, x_3, x_4, y = 0) &= p(y = 0) \cdot p(x_1, x_2, x_3, x_4 | y = 0) \\
 &= p(y = 0) \cdot p(x_1 | y = 0) \cdot p(x_2 | y = 0) \cdot p(x_3 | y = 0) \cdot p(x_4 | y = 0)
 \end{aligned}$$

16

Class prior distribution

17

$$p(x, y) = p(y)p(x|y) = p(y) \prod_{d=1}^D p(x_d | y)$$

Class prior distribution Class conditional distribution

For the **class prior distribution**, take categorical distribution.

$$y \sim \text{Categorical}(\pi), \quad \pi \in \mathbb{R}^C, \pi_c \geq 0, \sum_c \pi_c = 1$$

$$\Rightarrow p(y = c) = \pi_c$$

Example: biased 4-sided die Y , given:

- $P(Y=1) = 0.2, P(Y=2) = 0.3, P(Y=3) = 0.1, P(Y=4) = 0.4$

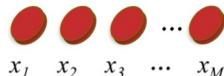

17

Class prior distribution

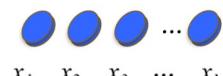

Flip weighted coin y

If HEADS, flip each red coin
 $x_1, x_2, x_3, \dots, x_M$

If TAILS, flip each blue coin
 $x_1, x_2, x_3, \dots, x_M$

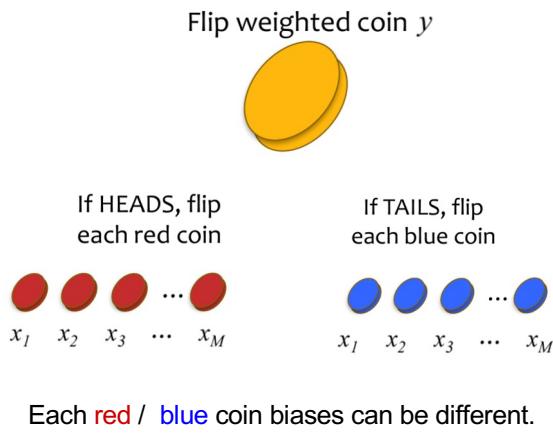

y	x_1	x_2	x_3	...	x_M
0	1	0	1	...	1
1	0	1	0	...	1
1	1	1	1	...	1
0	0	0	1	...	1
0	1	0	1	...	0
1	1	0	1	...	0

$$p(y)$$

18

Class conditional distribution

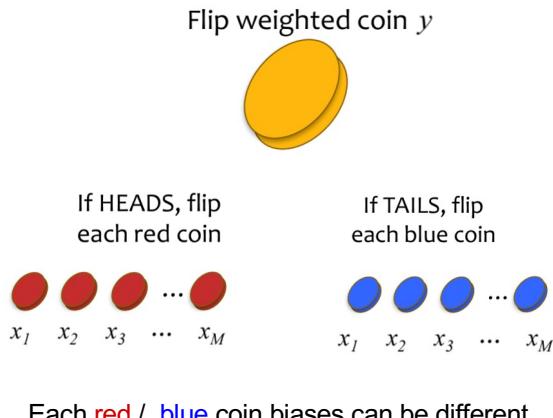

y	x_1	x_2	x_3	\dots	x_M
0	1	0	1	\dots	1
1	0	1	0	\dots	1
1	1	1	1	\dots	1
0	0	0	1	\dots	1
0	1	0	1	\dots	0
1	1	0	1	\dots	0

$p(x_1|y = 1)$

19

Class conditional distribution

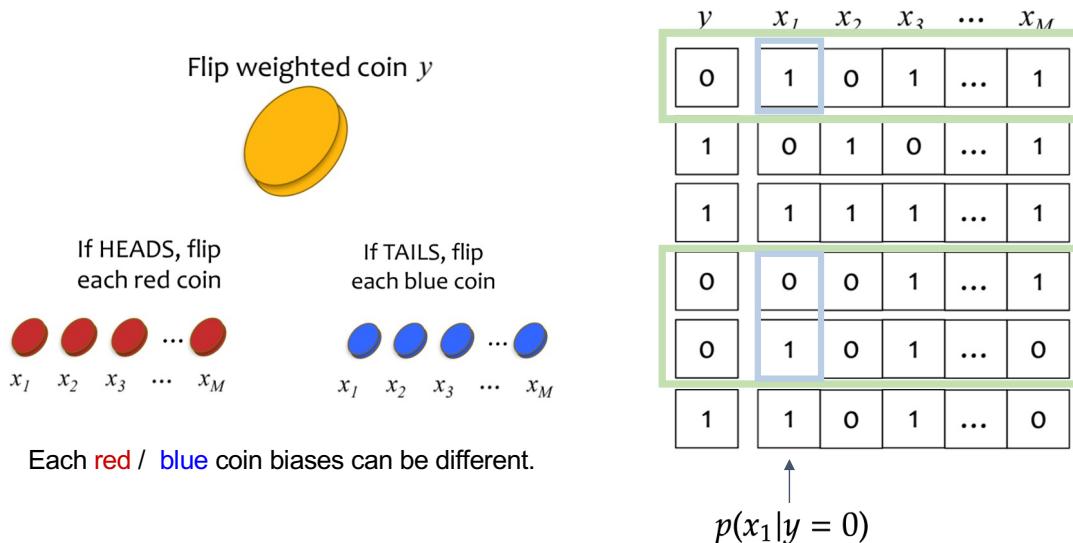

y	x_1	x_2	x_3	\dots	x_M
0	1	0	1	\dots	1
1	0	1	0	\dots	1
1	1	1	1	\dots	1
0	0	0	1	\dots	1
0	1	0	1	\dots	0
1	1	0	1	\dots	0

$p(x_2|y = 1)$

20

Class conditional distribution

21

22

Class conditional distribution

Simplifying Assumption: “*Class conditional*” distribution assumes features are conditionally independent given class

$$p(x | y) = \prod_{d=1}^D p(x_d | y)$$

- “Naïve” as in general features are likely to be dependent.
- Every feature can have a different class-conditional distribution

↓

$P(x_1|y)$ can be different from $P(x_2|y)$

22

11

Class conditional distribution

23

Features are typically not independent!

Example 1 If a recent news article contains word “Donald” it is much more likely to contain the word “Trump”.

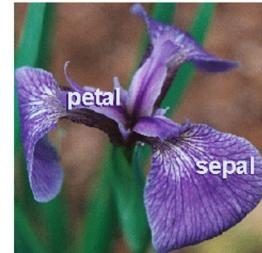

ELECTION 2016 • MORE ELECTION COVERAGE

Trump Spends Entire Classified National Security Briefing Asking About Egyptian Mummies

NEWS IN BRIEF August 16, 2016
VOL. 32 ISSUE 32 • Politics • Politicians • Election 2016 • Donald Trump

Example 2 If flower petal width is very large then petal length is also likely to be high.

Source: [Matt Gormley](#)

23

Class conditional distribution

24

Simplifying Assumption: “*Class conditional*” distribution assumes features are conditionally independent given class

$$p(x | y) = \prod_{d=1}^D p(x_d | y)$$

- “Naïve” as in general features are likely to be dependent.
- Every feature can have a different class-conditional distribution

Doesn’t capture correlation among features. But why would it be a good idea?

- Easy computation: For C classes and D features only $O(CD)$ parameters
- Prevents overfitting
- Simplicity

24

12

Class conditional distribution

25

For real-valued features we can use Normal distribution:

$$p(x | y = c) = \prod_{d=1}^D \mathcal{N}(x_d | \mu_{cd}, \sigma_{cd}^2)$$

Parameters of featured for class c

quiz candidate
Q: how many parameters?
 $2cd$

For binary features $x_d \in \{0,1\}$ can use Bernoulli distributions:

$$p(x | y = c) = \prod_{d=1}^D \text{Bernoulli}(x_d | \theta_{cd})$$

quiz candidate
Q: how many parameters?
 cd

“Coin bias” for d^{th} feature
and class c

- K-valued discrete features: use Categorical.
- Can mix-and-match, e.g. some discrete, some continuous features

$$p(x | y = c) = \prod_{d=1}^{D'} \text{Bernoulli}(x_d | \theta_{cd}) \prod_{d=D'+1}^D \mathcal{N}(x_d | \mu_{cd}, \sigma_{cd}^2)$$

25

Naïve Bayes Model : Maximum Likelihood

26

Fitting the model requires learning all parameters...

$$p(x, y = c) = p(y = c; \pi) \prod_{d=1}^D p(x_d | \theta_{cd})$$

Class Prior Parameters

Likelihood Parameters

Given training data $\mathcal{D} = \{(x^{(i)}, y^{(i)})\}_{i=1}^N$ maximize the likelihood function,

$$\theta^{\text{MLE}} = \arg \max_{\pi, \theta} \log p(\mathcal{D}; \pi, \theta)$$

26

Naïve Bayes Model : Maximum Likelihood

27

$$\theta^{\text{MLE}} = \arg \max_{\pi, \theta} \log p(\mathcal{D}; \pi, \theta) \quad (\mathcal{D} := \{(x^{(i)}, y^{(i)})\}_{i=1}^m)$$

Since data are iid

$$= \arg \max_{\pi, \theta} \log \prod_{i=1}^m p(x^{(i)}, y^{(i)}; \pi, \theta)$$

log(ab) = log a + log b

$$= \arg \max_{\pi, \theta} \sum_{i=1}^m \log p(x^{(i)}, y^{(i)}; \pi, \theta)$$

**Conditional probability +
Naïve Bayes assumption**

$$= \arg \max_{\pi, \theta} \sum_{i=1}^m \log p(y^{(i)}; \pi) + \sum_{i=1}^m \sum_{d=1}^D \log p(x_d^{(i)} | y^{(i)}; \theta_{y^{(i)} d})$$

θ_{cd} : parameter for feature d for class c

Find zero-gradient if concave, or gradient-based optimization otherwise

27

Example: Naïve Bayes with Bernoulli Features

28

Analogy:

y	x_1	x_2	...	x_D		
5	0	1	1	0	1	0
2	1	0	0	0	0	0
3	1	1	1	1	0	0
...	
4	0	0	1	1	0	1

28

Example: Naïve Bayes with Bernoulli Features

29

Let each feature follow a Bernoulli distribution then the model is...

$$y \sim \text{Categorical}(\pi) \quad x_d | y = c \sim \text{Bernoulli}(\theta_{cd})$$

The Naïve Bayes joint distribution is then:

$$\begin{aligned} p(\mathcal{D}; \pi, \theta) &= \prod_{i=1}^m \left(p(y^{(i)}; \pi) \prod_d p(x_d^{(i)}; \theta_{y^{(i)}d}) \right) \\ &= \prod_{i=1}^m \left(\prod_c \left(\pi_c^{\mathbf{I}\{y_i=c\}} \prod_j p(x_{ij} | \theta_{jc})^{\mathbf{I}\{y_i=c\}} \right) \right) \end{aligned}$$

Write down log-likelihood and optimize...

29

Example: Naïve Bayes with Bernoulli Features

30

j: feature, c: label, i: data

$$y \sim \text{Categorical}(\pi_c) : p(y = c) = \pi_c$$

$$p(y = 1) = \pi_1$$

$$p(y = 2) = \pi_2$$

$$p(y = 3) = \pi_3 = 1 - \pi_1 - \pi_2$$

Q: how many parameters?

c-1+cj

y	x ₁	x ₂
1	0	1
3	1	0
3	1	1
2	0	0
1	1	0

$$x|y \sim \text{Bernoulli}(\theta_{jc}) : p(x|y) = \theta_{jc}^x (1 - \theta_{jc})^{1-x}$$

$$x_{j=1}|y = 1 \sim \text{Bernoulli}(\theta_{j=1,c=1}) \quad x_{j=2}|y = 1 \sim \text{Bernoulli}(\theta_{j=2,c=1})$$

$$x_{j=1}|y = 2 \sim \text{Bernoulli}(\theta_{j=1,c=2}) \quad x_{j=2}|y = 2 \sim \text{Bernoulli}(\theta_{j=2,c=2})$$

$$x_{j=1}|y = 3 \sim \text{Bernoulli}(\theta_{j=1,c=3}) \quad x_{j=2}|y = 3 \sim \text{Bernoulli}(\theta_{j=2,c=3})$$

$$\prod_{i=1}^5 \left(\left(\pi_{c=1}^{I(y_i=1)} \cdot p(x_{i,j=1} | \theta_{j=1,c=1}) \cdot p(x_{i,j=2} | \theta_{j=2,c=1}) \right) \cdot \left(\pi_{c=2}^{I(y_i=2)} \cdot p(x_{i,j=1} | \theta_{j=1,c=2}) \cdot p(x_{i,j=2} | \theta_{j=2,c=2}) \right) \cdot \right.$$

$$\left. \left(\pi_{c=3}^{I(y_i=3)} \cdot p(x_{i,j=1} | \theta_{j=1,c=3}) \cdot p(x_{i,j=2} | \theta_{j=2,c=3}) \right) \right)$$

30

Bernoulli Naïve Bayes MLE

31

Let $m_c := \sum_{i=1}^m \mathbf{I}\{y^{(i)} = c\}$ be number of training examples in class c then,

$$\sum_{i=1}^m \log p(\mathcal{D}; \pi, \theta) = \sum_{c=1}^C m_c \log \pi_c + \sum_{c=1}^C \sum_{i:y^{(i)}=c} \sum_{d=1}^D \log p(x_d^{(i)}; \theta_{cd})$$

Log-likelihood function is concave in all parameters so...

1. Take derivatives with respect to π and θ separately.
2. Set derivatives to zero and solve

$\hat{\pi}_c = \frac{m_c}{m}$	Fraction of training examples from class c	$\hat{\theta}_{cd} = \frac{m_{cd}}{m_c}$	Number of “heads” in training set from class c
$m_{cd} = \sum_{i=1}^m I\{y^{(i)} = c, x_d^{(i)} = 1\}$			

31

Example: Naïve Bayes with Bernoulli Features

32

Analogy:

y	x_1	x_2	...	x_D		
5	0	1	1	0	1	0
3	1	0	0	0	0	0
3	1	1	1	1	0	0
...	...					
4	0	0	1	1	0	1

$$\hat{\pi}_c = \frac{m_c}{m}$$

$$\hat{\theta}_{cd} = \frac{m_{cd}}{m_c}$$

$$m_{cd} = \sum_{i=1}^m I\{y^{(i)} = c, x_d^{(i)} = 1\}$$

$$\hat{\pi}_3 = \frac{\# \text{ number of } y = 3}{\# \text{ total data}}$$

$$\hat{\theta}_{3,2} = \frac{\# \text{ number of } y = 3 \text{ and } x_2 = 1}{\# \text{ number of } y = 3}$$

32

Bernoulli Naïve Bayes: making prediction

$$\hat{\pi}_c = \frac{m_c}{m}$$

$$\hat{\theta}_{cd} = \frac{m_{cd}}{m_c}$$

Given one data point, it has 4 features (input), compare the probabilities:

$$\begin{aligned} p(x_1, x_2, x_3, x_4, y = 0) &= p(y = 0) \cdot p(x_1, x_2, x_3, x_4 | y = 0) \\ &= p(y = 0) \cdot p(x_1 | y = 0) \cdot p(x_2 | y = 0) \cdot p(x_3 | y = 0) \cdot p(x_4 | y = 0) \end{aligned}$$

$$\begin{aligned} p(x_1, x_2, x_3, x_4, y = 1) &= p(y = 1) \cdot p(x_1, x_2, x_3, x_4 | y = 1) \\ &= p(y = 1) \cdot p(x_1 | y = 1) \cdot p(x_2 | y = 1) \cdot p(x_3 | y = 1) \cdot p(x_4 | y = 1) \end{aligned}$$

33

Bernoulli Naïve Bayes MLE: issue

no data points of class 2:

$$p(y = 2) = 0$$

y	x_1	x_2
1	0	1

3	0	0
---	---	---

no data points in class 1 & 3 is 1:

$$p(x_1 = 0 | y = 3) = 0$$

1	0	0
---	---	---

$$p(x_1 = 0 | y = 1) = 0$$

?	1	0
---	---	---

34

Bernoulli Naïve Bayes MLE: issue

35

What if there are *no* examples of class c in the training set?

$$\hat{\pi}_c = 0 \quad \text{Model will never learn to guess class c}$$

What if all data points i in class c has $x_d^{(i)} = 0$ in the training set?

$$\hat{\theta}_{cd} = 0 \quad \text{Model will assign 0 likelihood for test data with } x_d = 1 \text{ for class c (i.e., } p(x|y = c) \text{).}$$

What does it imply on $p(y = c|x)$? 0!

Training data needs to see *every possible outcome* for each feature

Any ideas how we can fix this problem?

35

Fixing Bernoulli MLE

36

We could add a small constant to prevent zero probabilities...

$$\hat{\pi}_c \propto m_c + \alpha \quad \hat{\theta}_{cj} \propto m_{cj} + \beta \quad \alpha, \beta > 0$$

Pseudocounts
add- α Smoothing
Laplace smoothing

...

typical choice: set $\alpha = \beta = 1$

Another smoothing method:

$$\hat{P}(w_i|c) = \frac{\text{count}(w_i, c) + 1}{\sum_{w \in V} (\text{count}(w, c) + 1)} = \frac{\text{count}(w_i, c) + 1}{(\sum_{w \in V} \text{count}(w, c)) + |V|}$$

Word count in category c

18

Naïve Bayes in Sentiment Classification

	Cat	Documents
Training	-	just plain boring entirely predictable and lacks energy no surprises and very few laughs + very powerful + the most fun film of the summer
Test	?	predictable with no fun

$$\hat{\pi}_c = \frac{m_c}{m} \quad P(-) = \frac{3}{5} \quad P(+) = \frac{2}{5}$$

37

Naïve Bayes in Sentiment Classification

$$\hat{P}(w_i|c) = \frac{\text{count}(w_i, c)}{\sum_{w \in V} \text{count}(w, c)}$$

smoothing

$$\frac{\text{count}(w_i, c) + 1}{(\sum_{w \in V} \text{count}(w, c)) + |V|}$$

	Cat	Documents
Training	-	just plain boring entirely predictable and lacks energy no surprises and very few laughs + very powerful + the most fun film of the summer
Test	?	predictable with no fun

Vocabulary size

$$20 = 14 + 9 - 3$$

3: the, and, very (duplicate)

$$P(\text{"predictable"}|-) = \frac{1+1}{14+20} \quad P(\text{"predictable"}|+) = \frac{0+1}{9+20}$$

$$P(\text{"no"}|-) = \frac{1+1}{14+20} \quad P(\text{"no"}|+) = \frac{0+1}{9+20}$$

$$P(\text{"fun"}|-) = \frac{0+1}{14+20} \quad P(\text{"fun"}|+) = \frac{1+1}{9+20}$$

38

Naïve Bayes in Sentiment Classification

	Cat	Documents
Training	-	just plain boring entirely predictable and lacks energy no surprises and very few laughs + very powerful + the most fun film of the summer
Test	?	predictable with no fun

Ignore unknown words

$$P(-)P(S|-) = \frac{3}{5} \times \frac{2 \times 2 \times 1}{34^3} = 6.1 \times 10^{-5}$$

$$P(+)P(S|+) = \frac{2}{5} \times \frac{1 \times 1 \times 2}{29^3} = 3.2 \times 10^{-5}$$

The model thus predicts the class *negative* for the test sentence.

Naïve Bayes in Scikit-learn

Scikit-learn has separate classes each feature type

`sklearn.naive_bayes.GaussianNB`

Real-valued features

`sklearn.naive_bayes.MultinomialNB`

Discrete K-valued feature counts (e.g. multiple die rolls)

`sklearn.naive_bayes.BernoulliNB`

Binary features (e.g. coinflip)

`sklearn.naive_bayes.CategoricalNB`

Discrete K-valued features (e.g. single die roll)

For large training data that
don't fit in memory use
Scikit-learn's out-of-core
learning
